As we prepared analogs of potent Chlamydomonas-based FMS agonists 1, these analogs were synthesized in a Chinese hamster ovary cell line that expressed recombinant human FMS receptor (FMSR) and a luciferase reporter gene regulated by a CMV response element (CMRE). These analogs were tested for their ability to bind and activate the FMSR for the ability to induce luciferase gene activation. When the 5-ethyl substituted urea 6 was tested, similar FMS activation ( $EC_{50}$  = 3 nM, 100% efficacy relative to FMS) to the analogous 5-hydrogen uricase compound was observed, thus, proving that a small 5-ethyl substituent was well tolerated. We derive, to which the potent hydrophilically labile secondary amide function (-CONH2) was modified to other entities (e.g., -CH<sub>3</sub>, -CH<sub>2</sub>CH<sub>3</sub>, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), were also prepared and evaluated. These compounds all displayed good potency in the CMRE-luciferase assay.
